Status Report

Accomplishments since Project Start

Since the start of the project, we have completed the following milestones:

- Project Started;
- Project Plan Approved;
- Described Current Processes;
- Reviewed Project Requirements;
- Framework Interface Design Finished;
- Tests Specification Defined;
- Finished Module 1 Implementation;

Milestones expected to be reached

By the 14th of February, we expect to have reached:

- Finished Module 2 Implementation (on the 7th of February);

Current status of Project Performance

Currently, we are 12 days in total behind schedule, being it due to the 4 extra working days from postponing the project plan approval, 5 working days from adding the new ISHR interface specification activity and the weekends that occur between these activities.

Change Request

Regarding the Holidays and Absences Module, new requirements (out of the scope of the project) were identified. In this meeting, we propose to implement these in our project, taking into account that the estimated effort of this work is 2 weeks, with a full allocation of the Technical Coordinator's team. This change will lead to a delay in our project, as this module will turn the Realization package into the critical path (meaning that if it delays, there is no slack). In total this request will cause a 12 day delay and an added price of 8650€.

Note: From this point on, we include the predictions made in the meeting of the 24th of January.

Risk Assessment Update

| | |
|--|---|
| Machines not arriving on time | The delaying of the Hardware to the 28th of February overcomes the slack given for that Work Package, also delaying the Software Installation work package, and consequently, the whole project. This risk's consequence will change from Low to High since the Hardware is now on the critical path. The Probability reduced from Low to Very Low as it has already been delayed once. |
| Machines not arriving in conditions | Even though the probability of the machines arriving late again is low, it can still arrive with unforeseen defects. As such, the Consequence of the risk also changes from Low to High and the probability remains the same. |
| Technical coordinator leaving project | Although the technical coordinator hasn't left the project as of January 31st, some major features that are to be done by the technical team haven't been completed yet. However, some features have already been completed, so the consequence may be lowered, although the probability of the risk still persists nonetheless. As such, the consequence of this risk has been reduced from Very High to High. |
| HRD Delegate leaving the project | Currently, the HRD Delegate still remains in the project, but it does not mean that he cannot yet leave. Although he has completed a lot of the activities in which he is needed, his departure can still pose a big delay to our project. As such, both Consequence and Probability stay the same. |
| Bad quality of data to be migrated | As we have not yet seen the state of the data to be migrated, we will keep this risk unchanged. |
| HRD employees not collaborating, delaying tasks | So far, in all the activities in which we worked with the HRD employees, they have been very collaborative and have not boycotted the tasks. Although we can not be sure that they will not in the future, we can trust their goodwill that the chances are low. We have lowered the Probability from Low to Very Low but kept the Consequence to High, as it can still delay the whole project if it occurs in the future. |
| Interface implementation setbacks | With the processes for Interface Implementation described and discussed with the ISTRetail Technical Coordinator as well as the Interface specified, we can |

| | |
|--|---|
| | predict that some problems with the integration are more likely to occur than predicted. As such, we raise the Probability from Medium to High. |
|--|---|

These are the updated entries on the Risk Register presented in the proposal:

| | Description | Assumptions | Probability | | | | | Consequences | | | | | Probability/Consequences Justification | Treatment | | Risk Owner |
|------|--|---|-------------|---|---|---|----|--------------|---|---|---|----|---|-------------|---|---------------|
| | | | VL | L | M | H | VH | VL | L | M | H | VH | | Type | Measure(s) | |
| Risk | Machines not arriving in proper conditions | Hardware may have defects | | X | | | | | | | | X | If the machines aren't in a good state, it can cause some delays on the project | Mitigation | Remind the client to check the machines in advance | Tech Tics |
| Risk | Machines not arriving on time | Hardware may not be available on the expected time | X | | | | | | | | | X | If the arrival date is not assured it can cause some delays on the project | Mitigation | Remind the client to obtain the machines in advance | Tech Tics |
| Risk | Technical Coordinator leaving the project | Technical Coordinator has been working in the company for a long time and is looking for different challenges | | | X | | | | | | | X | Our Technical Coordinator is involved in 82% of all work packages and executes 64% of these. His departure would cause disastrous effects on our project with innumerable delays on the workflow. | Contingency | Have another person monitoring the project and be ready to takeover in case of his departure. | Tech Tics |
| Risk | HRD Delegate leaving the project | HRD Delegate has received an offer from another company | | | X | | | | | | | X | The HRD Delegate is a very important piece of our project, as he will be not only be our main consultant from the client side as he will also decide on the Corporate Information Module functionalities. If his departure happens on the early stages of the project, it will majorly delay our schedule | Deflection | Let the client negotiate with the HRD Delegate; Have another person ready to take over in case of his departure. | Client |
| Risk | Interface Integration setbacks | ISHR system is a blackbox with little information about it | | | | X | | | | X | | | Because of the blackbox nature of the ISHR system, it is likely that unexpected problems will be found while integrating our interface, which can lead to a delay of the work package | Mitigation | Ask for documentation or more information regarding the ISHR system | Tech Tics |

Figure 1 - Updated Risk Register Entries

Corrective Actions Plan

| | |
|---|---|
| Machines not arriving on time | As we have no power in relation to the arrival of the machines and with this delay, we will still be within the range of delivery for project success, we will not add any corrective action. |
| Interface Implementation setback | To prevent further delays on our project, a 3-day allowance should be given to this work package, as delays are likely to occur. |
| Planned Vacations | Due to the vacations planned some delays can occur in our project, specifically in relation to the Interface Implementation and planning of the Hardware installation. As such, we pushed the dates of these activities for after the vacations. Because of this, conflicts of resource management arise. As such, the Hardware Installation is now dependent on the Integration Tests, as we need the client team to make the Hardware Installation. |

Appendix B (internal)

Earned Value Analysis:

Figure 2 - Earned Value Analysis

Where:

- EAC - Estimate at Completion
- ACWP - Actual Cost
- BCWP - Earned Value
- BCWS - Planned Value

Throughout the project, until now, the Actual Cost was higher than the Earned Value, meaning that the project is over budget. Similarly, the Planned Value was also above the Earned Value, meaning that the project is behind schedule.
